REMARK ON REGULARITY CRITERION FOR WEAK SOLUTIONS
TO THE SHEAR THINNING FLUIDS

JAE-MYOUNG KIM, Andong

Received January 13, 2023. Published online June 12, 2023.
Communicated by Ondřej Kreml

Abstract. J. Q. Yang (2019) established a regularity criterion for the 3D shear thinning fluids in the whole space \mathbb{R}^3 via two velocity components. The goal of this short note is to extend this result in viewpoint of Lorentz space.

Keywords: shear thinning fluids; regularity criterion

MSC 2020: 76D05, 35Q35

1. INTRODUCTION

In this paper, we study the shear thinning fluids:

$$(1.1) \quad \begin{cases} u_t - \nabla \cdot (|Du|^{p-2} Du) + (u \cdot \nabla) u + \nabla \pi = f, \\ \operatorname{div} u = 0 \end{cases} \quad \text{in } Q_T := \mathbb{R}^3 \times (0, T),$$

where $u = (u_1, u_2, u_3): \mathbb{R}^3 \times (0, T) \rightarrow \mathbb{R}^3$ is the flow velocity vector, $\pi: \mathbb{R}^3 \times (0, T) \rightarrow \mathbb{R}$ is the pressure. Also, $Du = \frac{1}{2}(\nabla u + \nabla u^T)$. We consider the initial value problem of (1.1), which requires initial conditions

$$(1.2) \quad u(x, 0) = u_0(x), \quad x \in \mathbb{R}^3.$$

We assume that the initial data $u_0(x) \in L^2(\mathbb{R}^3)$ hold the incompressibility, i.e., $\operatorname{div} u_0(x) = 0$.

The non-Newtonian flows is a fluid such that the relation between the shear stress and the shear strain rate is non-linear. Typical examples are as follows: honey, blood, paint, melted butter and corn starch (see e.g. [2], [5], [14]).

This work was supported by a Research Grant of Andong National University.

We report shortly some known results related to the existence of solutions and regularity issues. The existence of weak solutions was firstly shown for $\frac{11}{5} \leq q$ in [9]–[11], and later, the result was improved up to $\frac{6}{5} < q$ in [7]. Here, weak solutions are meant to solve the equations in the sense of distributions and satisfy

$$\sup_{0 \leq t \leq T} \|u(t)\|_{L^2(\mathbb{R}^3)}^2 + \int_0^T \|\nabla u(t)\|_{L^q(\mathbb{R}^3)}^q dt \leq C \|u_0\|_{L^2(\mathbb{R}^3)}^2.$$

Málek et al. proved in [13] that a strong solution exists globally in time in periodic domains for $q \geq \frac{11}{5}$ in \mathbb{R}^3 (see [17] for the whole space case). Here by strong solutions we mean solutions satisfying the following energy estimate:

$$\sup_{0 \leq t \leq T} \|u(t)\|_{H^1(\mathbb{R}^3)}^2 + \int_0^T \int_{\mathbb{R}^3} |Du|^{q-2} |\nabla Du|^2 dt \leq C \|u_0\|_{H^1(\mathbb{R}^3)}^2.$$

Also, they established local existence of strong solution in time for $q > \frac{5}{3}$ in three dimensional periodic domains (refer to [4] for shear thinning case, $\frac{7}{5} < q < 2$).

When $\frac{8}{5} < p \leq 2$, in particular, for the regularity issue for (1.1), Bae et al. (see [3]) obtained the following regularity of weak solutions of (1.1)–(1.2) in the class

$$(1.3) \quad u \in L^\beta(0, T; L^\alpha(\mathbb{R}^3)), \quad \frac{3}{\alpha} + \frac{5p-6}{2\beta} \leq \frac{5p-8}{2}, \quad \alpha > \frac{6}{5p-8}.$$

On the other hand, Yang in [19] improved regularity condition (1.3) by only the two-component velocity field. More precisely, for $\tilde{u} = (u_1, u_2, 0)$ he proved the regularity of weak solutions in the class

$$(1.4) \quad \tilde{u} \in L^\beta(0, T; L^\alpha(\mathbb{R}^3)), \quad \frac{3}{\alpha} + \frac{5p-6}{2\beta} \leq \frac{5p-8}{2}, \quad \alpha > \frac{6}{5p-8}.$$

For $\alpha = \infty$, Ahmad et al. (see [1]) improved Yang's result (1.4). More precisely, for $\tilde{u} = (u_1, u_2, 0)$ he proved the regularity of weak solutions in the class

$$\tilde{u} \in L^{(5p-6)/(5p-8)}(0, T; \text{BMO}(\mathbb{R}^3)).$$

In this direction, our main result is read as follows:

Theorem 1.1. *Suppose that u is a weak solution to (1.1)–(1.2) with $\frac{8}{5} < p \leq 2$. Then there exists a constant $\delta > 0$ such that u is a strong solution on $(0, T]$ provided that $u \in L^{\beta, \infty}(0, T; L^{\alpha, \infty}(\mathbb{R}^3))$ and*

$$\|u\|_{L^{\beta, \infty}(0, T; L^{\alpha, \infty}(\mathbb{R}^3))} \leq \delta \quad \text{with} \quad \frac{3}{\alpha} + \frac{5p-6}{2\beta} \leq \frac{5p-8}{2}, \quad \alpha > \frac{6}{5p-8}.$$

Theorem 1.2. Suppose that u is a weak solution to (1.1)–(1.2) with $\frac{8}{5} < p \leq 2$. Then there exists a constant $\delta > 0$ such that u is a strong solution on $(0, T]$ provided that $\tilde{u} \in L^{\beta, \infty}(0, T; L^{\alpha, \infty}(\mathbb{R}^3))$ and

$$\|\tilde{u}\|_{L^{\beta, \infty}(0, T; L^{\alpha, \infty}(\mathbb{R}^3))} \leq \delta \quad \text{with } \frac{3}{\alpha} + \frac{5p - 6}{2\beta} \leq \frac{5p - 8}{2}, \quad \alpha > \frac{6}{5p - 8}.$$

Remark 1.3. For a half space \mathbb{R}_+^3 with the slip boundary condition instead of \mathbb{R}^3 , our results are also established due to Sobolev embedding (see e.g. [8], pages 215–216).

2. PRELIMINARIES

In this subsection we introduce the notation. For $1 \leq q \leq \infty$, we denote by $W^{k,q}(\Omega)$ the usual Sobolev spaces, namely $W^{k,q}(\Omega) = \{f \in L^q(\Omega) : D^\alpha f \in L^q(\Omega), 0 \leq |\alpha| \leq k\}$. The set of q th power Lebesgue integrable functions on Ω is denoted by $L^q(\Omega)$ and $L_{\text{loc}}^q(\Omega)$ indicates the set of locally q th power Lebesgue integrable functions defined on Ω . Let $\mathcal{O} \subset \Omega$ and $J \subset I$, we denote $\|f\|_{L_{x,t}^{p,q}(\mathcal{O} \times J)} = \|\|f\|_{L^p(\mathcal{O})}\|_{L^q(J)}$. For vector fields u, v we write $(u_i v_j)_{i,j=1,2,3}$ as $u \otimes v$. We denote by $A : B = a_{ij} b_{ij}$ the 3×3 matrices $A = (a_{ij})$, $B = (b_{ij})$. The letter C is used to represent a generic constant, which may change from line to line. Before the proof, we will list some lemmas needed for the proof. First of all, we recall Korn's inequality in [17], Lemma 2.7.

Lemma 2.1. Let $1 < q < \infty$. Assume that u is in $W^{1,q}(\mathbb{R}^3)$. Then

$$\|\nabla u\|_{L^q(\mathbb{R}^3)} \leq C \|Du\|_{L^q(\mathbb{R}^3)},$$

where C is a positive constant depending on q .

We recall a key estimate for the stress tensor in [3] or [19].

Lemma 2.2. Let $1 < p < 2$. Suppose that $u \in W^{2,s}(\mathbb{R}^3)$ for $1 < s < 2$. Then

$$\begin{aligned} \int_{\mathbb{R}^3} |\nabla^2 u|^s dx &\leq C \left(\int_{\mathbb{R}^3} \sum_{i,j=1}^3 \nabla(|D(u)|^{p-2} D_{i,j}(u)) \cdot \nabla D_{i,j}(u) dx \right)^{s/2} \\ &\quad \times \left(\int_{\mathbb{R}^3} |\nabla u|^{(2-p)s/(2-s)} dx \right)^{(2-s)/2}. \end{aligned}$$

For $s = p$, in particular, we have

$$\int_{\mathbb{R}^3} |\nabla^2 u|^p dx \leq \varepsilon \int_{\mathbb{R}^3} \sum_{i,j=1}^3 \nabla(|D(u)|^{p-2} D_{i,j}(u)) \cdot \nabla D_{i,j}(u) dx + C \int_{\mathbb{R}^3} |\nabla u|^p dx.$$

Next, we present some basic facts on Lorentz spaces $L^{p,q}(\Omega)$. For $p, q \in [1, \infty]$ we define

$$L^{p,q}(\mathbb{R}^3) = \{f: f \text{ is a measurable function on } \mathbb{R}^3 \text{ and } \|f\|_{L^{p,q}(\mathbb{R}^3)} < \infty\}$$

with

$$\|f\|_{L^{p,q}(\mathbb{R}^3)} = \begin{cases} \left(p \int_0^\infty \alpha^q |\{x \in \mathbb{R}^3: |f(x)| > \alpha\}|^{q/p} \frac{d\alpha}{\alpha} \right)^{1/q}, & q < \infty, \\ \sup_{\alpha > 0} \alpha |\{x \in \mathbb{R}^3: |f(x)| > \alpha\}|^{1/p}, & q = \infty. \end{cases}$$

And also, followed [18], Lorentz space may be defined by real interpolation methods as

$$L^{p,q}(\mathbb{R}^3) = (L^{p_1}(\mathbb{R}^3), L^{p_2}(\mathbb{R}^3))_{\alpha, q}$$

with

$$\frac{1}{p} = \frac{1-\alpha}{p_1} + \frac{\alpha}{p_2}, \quad 1 \leq p_1 < p < p_2 \leq \infty.$$

We also remind the Hölder inequality in Lorentz spaces (see [15]).

Lemma 2.3. Assume $1 \leq p_1, p_2 \leq \infty$, $1 \leq q_1, q_2 \leq \infty$ and $u \in L^{p_1, q_1}(\mathbb{R}^3)$, $v \in L^{p_2, q_2}(\mathbb{R}^3)$. Then $uv \in L^{p_3, q_3}(\mathbb{R}^3)$ with $1/p_3 = 1/p_1 + 1/p_2$ and $1/q_3 \leq 1/q_1 + 1/q_2$, and the inequality

$$\|uv\|_{L^{p_3, q_3}(\mathbb{R}^3)} \leq C \|u\|_{L^{p_1, q_1}(\mathbb{R}^3)} \|v\|_{L^{p_2, q_2}(\mathbb{R}^3)}$$

is valid.

We recall the following useful Gronwall lemma required in our proof which was first shown by [6] (see e.g. [16], [12]).

Lemma 2.4. Let φ be a measurable positive function defined on the interval $[0, T]$. Suppose that there exists $\kappa_0 > 0$ such that for all $0 < \kappa < \kappa_0$ and a.e. $t \in [0, T]$, φ satisfies the inequality

$$\frac{d}{dt} \varphi \leq \mu \lambda^{1-\kappa} \varphi^{1+2\kappa},$$

where $0 < \lambda \in L^{1,\infty}(0, T)$ and $\mu > 0$ with $\mu \|\lambda\|_{L^{1,\infty}(0,T)} < \frac{1}{2}$. Then φ is bounded on $[0, T]$.

3. REGULARITY CRITERION

P r o o f of Theorem 1.1. Testing $-\Delta u$ to the fluid equation of (1.1), respectively, and using integration by parts, we have

$$(3.1) \quad \begin{aligned} \frac{1}{2} \frac{d}{dt} \|\nabla u(\tau)\|_{L_x^2(\mathbb{R}^3)}^2 + \int_{\mathbb{R}^3} \sum_{i,j=1}^3 \nabla(|D(u)|^{p-2} D_{i,j}(u)) \cdot \nabla D_{i,j}(u) dx \\ = \int_{\mathbb{R}^3} (u \cdot \nabla) u \cdot \Delta u dx := A. \end{aligned}$$

Now, the first term A is computed as follows. Since $\alpha > 6/(5p-8) > 3p/(4p-6) > p/(p-1)$, we have

$$\begin{aligned} |A| &\leq \|u\|_{L^{\alpha,\infty}} \|\nabla u\|_{L^{p\alpha/(p\alpha-p-\alpha), p/(p-1)}} \|\nabla^2 u\|_{L^{p,6}} \\ &\leq \|u\|_{L^{\alpha,\infty}} \|\nabla u\|_{L^2}^{(8p\alpha-12\alpha-6p)/(5p-6)\alpha} \|\nabla u\|_{L^{3p/(3-p)}}^{3(2p+2\alpha-p\alpha)/(5p-6)\alpha} \|\nabla^2 u\|_{L^p} \\ &\leq \|u\|_{L^{\alpha,\infty}} \|\nabla u\|_{L^2}^{(8p\alpha-12\alpha-6p)/(5p-6)\alpha} \|\nabla^2 u\|_{L^p}^{(2p\alpha+6p)/(5p-6)\alpha} \\ &\leq \|u\|_{L^{\alpha,\infty}}^{\alpha(5p-6)/(5p\alpha-8\alpha-6)} \|\nabla u\|_{L^2}^{(8p\alpha-12\alpha-6p)/(5p\alpha-8\alpha-6)} + \varepsilon \|\nabla^2 u\|_{L^p}^p. \end{aligned}$$

Due to Lemma 2.2, the non-linear term A is estimated by

$$(3.2) \quad \begin{aligned} |A| &\leq \|u\|_{L^{\alpha,\infty}}^{\alpha(5p-6)/(5p\alpha-8\alpha-6)} \|\nabla u\|_{L^2}^{(8p\alpha-12\alpha-6p)/(5p\alpha-8\alpha-6)} \\ &\quad + \varepsilon_1 \varepsilon \int_{\mathbb{R}^3} \sum_{i,j=1}^3 \nabla(|D(u)|^{p-2} D_{i,j}(u)) \cdot \nabla D_{i,j}(u) dx + \varepsilon_1 C \int_{\mathbb{R}^3} |\nabla u|^p dx. \end{aligned}$$

With the energy estimate and (3.2), (3.1) becomes

$$(3.3) \quad \begin{aligned} \frac{d}{dt} (\|u(t)\|_{L_x^2(\mathbb{R}^3)}^2 + \|\nabla u(t)\|_{L_x^2(\mathbb{R}^3)}^2) \\ + \int_{\mathbb{R}^3} \sum_{i,j=1}^3 \nabla(|D(u)|^{p-2} D_{i,j}(u)) \cdot \nabla D_{i,j}(u) + |\nabla u|^p dx \\ \leq \|u\|_{L^{\alpha,\infty}}^{\alpha(5p-6)/(5p\alpha-8\alpha-6)} \|\nabla u\|_{L^2}^{(8p\alpha-12\alpha-6p)/(5p\alpha-8\alpha-6)} \\ \leq \|u\|_{L^{\alpha,\infty}}^{\alpha(5p-6)/(5p\alpha-8\alpha-6)} \\ \times \frac{1}{(1 + \|\nabla u\|_{L^2}^2)^{(4p\alpha-6\alpha-3p)/(5p\alpha-8\alpha-6)-1}} (1 + \|\nabla u\|_{L^2}^2) \\ \|u\|_{L^{\alpha,\infty}}^{\alpha(5p-6)/(5p\alpha-8\alpha-6)} (1 + \|\nabla u\|_{L^2}^2). \end{aligned}$$

Let $Y(t) := 1 + \|u(t)\|_{L_x^2(\mathbb{R}^3)}^2 + \|\nabla u(t)\|_{L_x^2(\mathbb{R}^3)}^2$ and thus (3.3) becomes

$$(3.4) \quad \frac{d}{dt} Y(t) \leq C \|u\|_{L^{\alpha,\infty}}^{\alpha(5p-6)/(5p\alpha-8\alpha-6)} Y(t).$$

We use an argument similar to the one used in the work of Bosia et al.: For $\varepsilon > 0$, let $\beta_\varepsilon = \beta + 2p\varepsilon((5p - 9)\beta - (5p - 6))/(5p - 6)$ and $(\alpha_\varepsilon, \beta_\varepsilon)$ be a Prodi-Serrin pair. We have

$$(3.5) \quad \|u\|_{L^{\alpha_\varepsilon, \infty}(\mathbb{R}^3)}^{\beta_\varepsilon} \leq \|u\|_{L^{\alpha, \infty}(\mathbb{R}^3)}^{\beta(1-\varepsilon)} \|u\|_{L^{6, \infty}}^{2p\varepsilon} \leq C \|u\|_{L^{\alpha, \infty}(\mathbb{R}^3)}^{\beta(1-\varepsilon)} \|\nabla u\|_{L^2(\mathbb{R}^3)}^{2p\varepsilon},$$

where we use

$$\|f\|_{L^{p, q_2}(\mathbb{R}^3)} \leq \left(\frac{q_1}{p}\right)^{1/q_1 - 1/q_2} \|f\|_{L^{p, q_1}(\mathbb{R}^3)}, \quad 1 \leq p \leq \infty, \quad 1 \leq q_1 < q_2 \leq \infty.$$

Since the pair $(\alpha_\varepsilon, \beta_\varepsilon)$ also meets $2/\alpha_\varepsilon + 3/\beta_\varepsilon = 2$, using (3.5), (3.4) becomes

$$\frac{d}{dt} Y(t) \leq C \|u\|_{L^{\alpha_\varepsilon, \infty}(\mathbb{R}^3)}^{\beta_\varepsilon} Y(t) \leq C \|u\|_{L^{\alpha, \infty}(\mathbb{R}^3)}^{\beta(1-\varepsilon)} Y(t)^{1+2\varepsilon}.$$

Applying Lemma 2.4, we obtain the desired result. \square

P r o o f of Theorem 1.2. The proof is almost the same as that for Theorem 1.1. Indeed, from the proof of Theorem 1.1, convection term A is decomposed with three parts as follows:

$$\begin{aligned} - \sum_{i,j=1}^3 \int_{\mathbb{R}^3} u_i \partial_i u_j \partial_{kk}^2 u_j \, dx &= \sum_{i=1}^2 \sum_{j,k=1}^3 \int_{\mathbb{R}^3} \partial_k u_i \partial_i u_j \partial_k u_j \, dx \\ &\quad + \sum_{j=1}^2 \sum_{k=1}^3 \int_{\mathbb{R}^3} \partial_k u_3 \partial_3 u_j \partial_k u_j \, dx \\ &\quad + \sum_{k=1}^3 \int_{\mathbb{R}^3} \partial_k u_3 \partial_3 u_3 \partial_k u_3 \, dx \\ &:= A_1 + A_2 + A_3. \end{aligned}$$

For A_1 and A_2 , by integration by parts, we have

$$\begin{aligned} A_1 &= - \sum_{i=1}^2 \sum_{j,k=1}^3 \int_{\mathbb{R}^3} u_i \partial_i u_j \partial_{kk}^2 u_j \, dx - \sum_{i=1}^2 \sum_{j,k=1}^3 \int_{\mathbb{R}^3} u_i \partial_k \partial_i u_j \partial_k u_j \, dx, \\ A_2 &= - \sum_{i=1}^2 \sum_{j,k=1}^3 \int_{\mathbb{R}^3} u_j \partial_3 u_j \partial_{kk}^2 u_3 \, dx - \sum_{i=1}^2 \sum_{j,k=1}^3 \int_{\mathbb{R}^3} u_j \partial_3 \partial_k u_j \partial_k u_3 \, dx. \end{aligned}$$

And thus, we know

$$(3.6) \quad |A_1|, |A_2| \leq C \int_{\mathbb{R}^3} |(\tilde{u} \cdot \nabla u) : \nabla^2 u| \, dx.$$

For A_3 , using the divergence free condition, we get

$$\begin{aligned}
A_3 &= - \sum_{k=1}^3 \int_{\mathbb{R}^3} \partial_k u_3 (\partial_1 u_1 + \partial_2 u_2) \partial_k u_3 \, dx \\
&= - \sum_{k=1}^3 \int_{\mathbb{R}^3} \partial_k u_3 \partial_1 u_1 \partial_k u_3 \, dx - \sum_{k=1}^3 \int_{\mathbb{R}^3} \partial_k u_3 \partial_2 u_2 \partial_k u_3 \, dx \\
&= - \sum_{k=1}^3 \int_{\mathbb{R}^3} u_1 \partial_1 \partial_k u_3 \partial_k u_3 \, dx - \sum_{k=1}^3 \int_{\mathbb{R}^3} u_1 \partial_k u_3 \partial_1 \partial_k u_3 \, dx \\
&\quad - \sum_{k=1}^3 \int_{\mathbb{R}^3} u_2 \partial_2 \partial_k u_3 \partial_k u_3 \, dx - \sum_{k=1}^3 \int_{\mathbb{R}^3} u_2 \partial_k u_3 \partial_2 \partial_k u_3 \, dx
\end{aligned}$$

and thus, we have

$$(3.7) \quad |A_3| \leq C \int_{\mathbb{R}^3} |(\tilde{u} \cdot \nabla u) : \nabla^2 u| \, dx.$$

Through (3.6) and (3.7), we can see that

$$|A| \leq C \int_{\mathbb{R}^3} |(u \cdot \nabla u) : \nabla^2 u| \, dx.$$

Hence, with the same approach as in Theorem 1.1, we finally obtain the result in Theorem 1.2. The proof is complete. \square
